Independent Professional Judgment

Xinnan Li | Individual assignment | November 3, 2026

My recommendation is to begin with an offline proof of concept for hypothetical Company A, after its knowledge owner verifies the reference policies and test-data use is approved. A live customer-facing pilot should remain conditional on acceptable evaluation results, data controls, and management approval. The strongest driver is the gap between plausible customer-service benefits and unverified local readiness, not enthusiasm for AI.

Company B should defer a live pilot and first establish knowledge ownership and consistent policies. It can then undertake the same offline evaluation, followed by its stricter approval process. These organizational differences change the appropriate action, not the underlying technology evidence.

The principal uncertainty is whether AI-assisted drafting improves total handling effort without reducing policy accuracy or increasing privacy risk. The external productivity study does not establish this retailer's return on investment. I would reconsider a limited live pilot after an audited reference set, satisfactory offline results against manual and template-based alternatives, and documented approvals. The proposed numerical gates require management review; they are not observed results or established safety standards. Neither case currently supports full deployment.
