AI Use and Verification

Xinnan Li | Individual assignment | November 3, 2026

ChatGPT/Codex helped interpret the assignment, instantiate the frozen scaffold, draft specialist instructions and hypothetical cases, locate evidence, generate two rounds of structured adoption analyses, diagnose weaknesses, and draft submission materials. The assistant generated both cases' responses in the same Codex conversation. These were not isolated independent model sessions, API executions, or real customer-service experiments. Python was used for file preparation, serialization and the supplied validation scripts, not to measure customer-service outcomes.

The assistant opened original-source materials and inspected relevant passages: the author-hosted 2025 published version of Generative AI at Work; NIST AI 600-1 (July 2024); Microsoft's RAG documentation (updated August 21, 2026); and the survey authors' November 13, 2025 St. Louis Fed report. Source dates, URLs, claims and limitations are preserved in records/shared_evidence.json, with access date November 3, 2026. NBER access returned 403, so accessible original-source alternatives were used. The published study's 15% result was distinguished from the earlier working-paper estimate; neither was treated as a forecast for the hypothetical firms. Diffusion data were dated, and vendor guidance was distinguished from independent outcome evidence. No jurisdiction-specific compliance clearance was claimed.

Both rounds' JSON outputs passed the supplied basic response validator; frozen-core integrity checks passed. These checks establish structural compliance and unchanged protected files, not factual correctness or sound judgment. Organizational attributes are assumptions; numerical test gates are proposals; no actual customer-service performance was measured. Remaining weaknesses include shared conversational context, unvalidated thresholds and missing local evidence. The student has confirmed the case assumptions and second-round judgment, but should inspect the cited passages before claiming personal source verification.
