Craft Gained

Xinnan Li | Individual assignment | November 3, 2026

I learned that a recommendation label can mislead even when its explanation contains sensible safeguards. In the first test, Company A received “bounded experiment,” although the analysis required offline checks before any customer exposure. Revising the agent to separate action now from conditional next steps changed the immediate recommendation to a proof of concept. I also learned to distinguish proposed evaluation thresholds from measured evidence. Next time, I will check whether recommendation labels match current authorization and whether each progression condition can actually be evaluated, rather than judging an agent mainly by how persuasive its prose sounds.
